Introduction to the industry 4.0

Activities

Profile

The first thing is the code about the profile of a person, character or person this time I did it about myself using for first time python I learnt how to print things in the screen and use variables to save data introduced by a user and how to print them.

LA.

The second code is about creating an artificial intelligence using input to get the data from the user and depending of the answers the program will give him different answers, I made this using if and else to be able to choose and option.

VUFORIA

The third activity was to take an image in order to upload it to vuforia, and check if the shapes are correct and forms are not repetitive for having something specific to detect, and it determines the number of stars, up to five. I like that image because is simple, and I think that the shapes in the image are perfect, in my case I got five stars(at least when I tried).

GitHub

Finally, the report, that has to be uploaded with the codes and the image to GitHub, creating an account to generate a link of my project that contains my files that allows the teacher to grade me.
